⚠ WARNING USER RESPONSIBILITY

FAILURE OR IMPROPER SELECTION OR IMPROPER USE OF THE PRODUCTS DESCRIBED HEREIN OR RELATED ITEMS CAN CAUSE DEATH, PERSONAL INJURY AND PROPERTY DAMAGE.

This document and other information from Parker Hannifin Corporation, its subsidiaries and authorized distributors provide product or system options for further investigation by users having technical expertise.

The user, through its own analysis and testing, is solely responsible for making the final selection of the system and components and assuring that all performance, endurance, maintenance, safety and warning requirements of the application are met. The user must analyze all aspects of the application, follow applicable industry standards, and follow the information concerning the product in the current product catalog and in any other materials provided from Parker or its subsidiaries or authorized distributors.

To the extent that Parker or its subsidiaries or authorized distributors provide component or system options based upon data or specifications provided by the user, the user is responsible for determining that such data and specifications are suitable and sufficient for all applications and reasonably foreseeable uses of the components or systems.

Offer of Sale

The items described in this document are hereby offered for sale by Parker Hannifin Corporation, its subsidiaries or its authorized distributors. Any Order accepted by Parker Hannifin will be subject to our terms and conditions of sale, copy available on request.

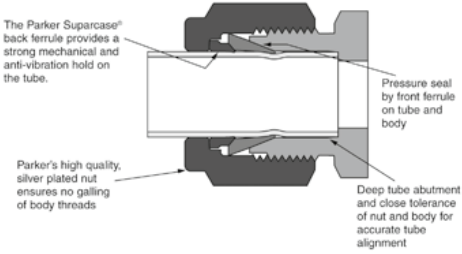
A-LOK® Principle

The A-LOK® two ferrule fitting consists of four precision engineered parts designed to provide secure leak-proof joints capable of satisfying high pressure, vacuum and vibration applications.

Fittings are supplied complete and ready for use. The front ferrule compresses onto the tube as it moves down the cone of the body creating a pressure/vacuum-tight seal on both tube and body by the interface pressure and surface finish of mating components. The Suparcase® back ferrule then deforms inwards in the cone of the front ferrule, forming into the tube and creating a strong mechanical hold on the tube.

The internal diameter of the body and nut are closely controlled diameters which constrain the tube within a close tolerance of its axis, ensuring accurate alignment within the assembled fitting.



CPI™ Principle

The CPI™ single ferrule fitting consists of three precision engineered parts designed to provide secure leak-proof joints capable of satisfying high pressure, vacuum and vibration applications.

Fittings are supplied complete and ready for use. The ferrule compresses onto the tube as it moves down the cone of the body creating a pressure/vacuum-tight seal on both tube and body by the interface pressure and surface finish of mating components.

The Suparcase® ferrule forms into the cone of the body and grips onto the tube, thus creating a strong mechanical hold.

The internal diameter of the body and nut are closely controlled diameters which constrain the tube within a close tolerance of its axis, ensuring accurate alignment within the assembled fitting.

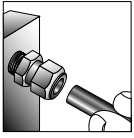
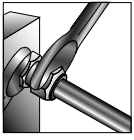
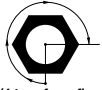
A-LOK® and CPI™ Assembly and remake instructions





INCH SIZE 1 thru 3 (1/16" - 3/16")
METRIC SIZE 2 thru 4 (2-4mm)



Only 3/4 turn from finger tight is necessary to seal and will result in additional remakes of the fitting

INCH SIZE 4 thru 16 (1/4" - 1")
METRIC SIZE 6 thru 25 (6-25mm)

1-1/4 Turns from Finger Tight

1. Parker A-LOK® and CPI™ instrument tube fittings are sold completely assembled and ready for immediate use. Simply insert the tube as illustrated until it bottoms in the fitting body. (If the fitting is disassembled, note that the small tapered end of the ferrule(s) go into the fitting body.)

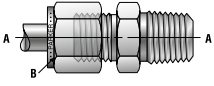
2. Tighten nut finger tight. Then tighten nut with spanner the appropriate amount as indicated on the diagram to the left. Hold fitting body with a second spanner to prevent body from turning. It is helpful to mark the nut to facilitate counting the number of turns.

For maximum number of remakes, mark the fitting and nut before disassembly. Before retightening, make sure the assembly has been inserted into the fitting until the ferrule seats in the fitting. Retighten the nut by hand.

Rotate the nut with a spanner to the original position as indicated by the previous marks lining up. (A noticeable increase in mechanical resistance will be felt indicating the ferrule is being re-sprung into sealing position.)

Only after several remakes will it become necessary to advance the nut slightly past the original position. This advance (indicated by B) need only be 10°-20° (less than 1/3 of a hex flat).

For Sizes above 16 (1"), the Parker IPD hydraulic presetting tool or Rotary spanner tool should be used. Cat. 4290-INST.



Parker CPI™/A-LOK® Tube Fitting part numbers use symbols to identify the size, style, and material. Tube and pipe thread sizes begin with a number indicating their size in sixteenths of an inch. For example, 4=4/16" or 1/4"; 16=16/16" or 1.

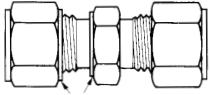
NOTE: Lubrication of the nut is REQUIRED for proper assembly on all LARGER size fittings in both inch and metric sizes. This requirement applies to:

- **inch sizes of 20 and higher**
- **metric sizes of 25 and higher**

For additional information please contact your local authorized Parker Instrumentation distributor or call Parker Instrumentation Products Division and ask for Bulletin 4230-B10.

How to identify metric fittings

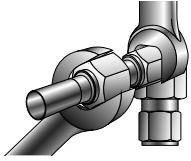
Metric tube fittings are identified by a stepped shoulder on both the body and the threaded end of the nut as illustrated.



Tel: +45 63 12 83 00 | Email: ps@hymatik.com | www.hymatik.com | Hvidkaervej 27a, DK-5250 Odense SV, Denmark

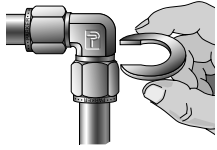
Gaugeability instructions for A-LOK®/CPI™

1. From “finger tight” position, spanner 1-1/4 turns for 1/4” to 1” size fittings (6mm to 25mm) (1/16”, 1/8”, 3/16”, 2mm 3mm and 4mm size tube fittings only spanner 3/4 turn from finger tight position).



Hold fitting body hex with second spanner to prevent body from turning as you tighten. It is a good idea to mark the nut (scribe or ink) to help you count the turns.

2. Now select the proper size inspection gauge and try to place it, as shown, between the nut and the body hex. If gauge DOES NOT FIT AT ANY POINT between them, you have correctly tightened the nut. If you can slip the gauge into the space, the fitting is not properly made up, and you must repeat the assembly procedure.



Gap gauge sizes

Part number	Tube size Inch	Metric mm
2 Gap Gauge	1/8	2-3
3 Gap Gauge	3/16	4
4 Gap Gauge	1/4	6
5 Gap Gauge	5/8	8
6 Gap Gauge	3/8	-
M10 Gap Gauge	-	10
8 Gap Gauge	1/2	12
10 Gap Gauge	5/8	14-15-16
12 Gap Gauge	3/4	18
14 Gap Gauge	7/8	20-22
16 Gap Gauge	1	25

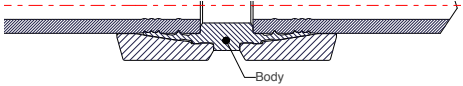
PHastite® Principle

A Ferrule-less Push-Fit Connector
PHastite® is a breakthrough in tube connection systems; its innovative design concept combines quick installation with a simple assembly process achieving a tube connector that can be used in applications up to 20,000 psi/ 1380 bar (see page 29).

The product is manufactured from standard materials and requires no special processes to be adopted.

PHastite® makes the perfect replacement for other fitting methods currently being utilised and performance parameters are such that it is suitable for pressure applications up to 20,000 psi/1380 bar (see page 29). Specifically, PHastite® is a reliable alternative to high pressure connections and/ or welded connectors in these applications.

Sealing
The excellent sealing and holding properties of PHastite® is achieved by its unique design. It not only secures metal to metal sealing points onto the tubing from its unique formed peaks within the bore of the connector body but allows the tubing to expand into the pre-machined cavities giving additional holding properties.



Testing
PHastite® meets all the relevant performance and functional requirements of industry standards, including pressure containment to a safety factor of a minimum of 4:1, proven by actual tubing burst tests. Throughout the development of PHastite®, product performance and integrity were paramount. A rigorous testing program including Thermal Cycling, Shock, Vibration, Helium Leak, Gas Tight and Hydrostatic testing has been completed.

PHastite®: The Benefits

Safety

- Supplied pre-assembled, no loose parts thus eliminating potential assembly errors.
- No additional operations using equipment that could lead to injury (such as hand held angle grinders) are required.
- Permanent assembly is tamper proof.
- Permanent leak free connections without the need for threaded components, thus removing potential loosening problems due to excess movement.
- No Hot Work! Fire or explosion risks are eliminated along with any potential fume inhalation.
- No disposal of hazardous materials used in any Hot Work activities.
- No brittleness or corrosion implications (caused by welding heat for example).

Tel: +45 63 12 83 00 | Email: ps@hymatik.com | www.hymatik.com | Hvidkaervej 27a, DK-5250 Odense SV, Denmark

PHastite® permanent connectors - The assembly process

The PHastite® fitting is supplied complete with the collars pre-assembled to the body, thus removing the risk of losing or incorrectly assembling components.

The tubes are simply inserted into the PHastite® connector, adequate tube insertion is assured by using the PHastite® tube marker.

Simple assembly to a metal to metal stop face ensures correct assembly every time, without counting turns or monitoring torque levels.

A series of formed ridges makes contact with the tubing surface uniformly to create both a multiple seal and a secure mechanical grip.

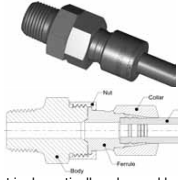
Tel: +45 63 12 83 00 | Email: ps@hymatik.com | www.hymatik.com | Hvidkaervej 27a, DK-5250 Odense SV, Denmark

PHastite® termination connectors - The assembly process

The PHastite® fitting is supplied complete with the collars pre-assembled to the body, retaining the swivel nut, thus removing the risk of losing or incorrectly assembling components.

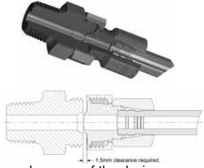
The tubes are simply inserted into the PHastite® connector, adequate tube insertion is assured by using the PHastite® tube marker.

Simple assembly to a metal to metal stop face ensures correct assembly every time, without counting turns or monitoring torque levels.



A series of formed ridges makes contact with the tubing surface uniformly to create both a multiple seal and a secure mechanical grip.

A mating conical arrangement provides leak tight sealing at the breakable joint, while correct assembly is ensured by a metal to metal stop face, without counting turns or monitoring torque levels.



The ability to 'break' and 'remake' the joint is dramatically enhanced by the virtual zero clearance of the design. Allowing the joint to be completely disconnected and removed without large pull out being required.

Tube markers

Adequate tube insertion is essential.

To achieve this, a range of PHastite® Tube Markers are available. The PHastite® Tube Marker generates two visible lines on to the outside diameter of the tube.

When inserting the tube into a PHastite® connector the two lines should not be visible. This ensures adequate tube insertion prior to assembly.

After assembly only one of the lines will be visible, ensuring that tube slippage has not occurred during assembly.

Two versions of these markers are available as follows:

Permanent tube marker
This style of tube marker generates two permanent lines onto the tube. These lines can be used for initial inspection during assembly and for future inspection. These tube markers generate the marks by means of a metallic ball bearing being rotated against the tube.

Temporary tube marker

This style of tube marker acts as a pen guide. This allows the user to mark the tube using a pen. These lines can be used for initial inspection during assembly however they cannot be used for future inspection.

Tube marker part numbers
Tube marker part numbers are as

follows:

PH-TUBEMARKER-*-#.

Where * must be replaced by ‘P’ for the permanent tube marker and ‘T’ for the temporary pen tube marker.

And # must be replaced with the tube size as follows:
For imperial sizes add the size in 1/16” of an inch increments i.e. 4 = 1/4” and 10 = 5/8”.
For metric sizes add ‘M’ followed by the size i.e. M6 = 6mm and M18 = 18mm.

Phastool

For connections up to 1/2” and 12mm.
For the smaller sizes of PHastite® a light weight hand tool is available for ease of installation. The hand tool is supplied complete with a 2 meter hose and quick connectors to suit a 3/8-14 NPT pump connection port.

Bench Mounting
The hand tool can also be supplied complete with an optional bench mountable tool holder.

For connections 1/2” to 1” and 12mm to 25mm
For larger sizes of PHastite® a light weight bench tool is available for ease of installation. The bench tool is supplied complete with a 2 meter hose and quick connectors to suit a 3/8-14 NPT pump connections port. The unit is also supplied complete with all required jaw inserts for assembling all PHastite® connectors including shapes and termination product from 1/2” to 1” and 12mm to 25mm.

MPI™ Principle

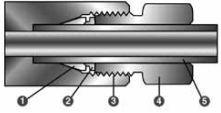
Introduction

Parker Hannifin MPI™ Fittings* are engineered and manufactured to provide secure, tight and leak resistant connections throughout industry, including off-shore oil and gas exploration platforms, research labs, and other facilities that require operating pressures in the range of 6,000 to 15,000 psi (414 to 1,034 bar). Please refer to pages 30/31 for further information.

MPI™ Fittings are ideally suited to handle liquids, gases, or chemicals and can be used on a wide variety of tubing materials including cold drawn - 1/8 hard (unannealed) tubing or instrument grade thick-walled annealed stainless steel. Every Parker MPI™ Fitting is supplied complete and ready to install.

Advanced Features

Every MPI™ Fitting has the features shown below:



1. Front ferrule with corrosion-resistant Parker SUPARCASE® forms a tight pressure seal between the body and ferrule in a second strong mechanical hold on the tube.
2. Rear ferrule with corrosion-resistant Parker SUPARCASE® provides a strong mechanical hold on the tube.
3. Longer thread area for improved resistance to pressure and load on the ferrules.
4. Molybdenum disulfide-coated inverted nut helps prevent galling, provides easier assembly, and permits multiple remakes.
5. Long tube-support area improves resistance to vibration and line loads.

Assembly

MPI™ Fittings are installed with standard hand tools. Each size can be preset with a Parker hydraulic preset tool. Tube preparation does not require cutting of threads or tube end "coning".

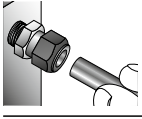
Dedication to quality

Our resources and vast product line, is available through our worldwide distribution network. For more information regarding our products and services, please contact your authorised Parker Instrumentation Distributor.

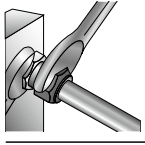
*U.S. Patent No. 6,851,729

MPI™ assembly, remake & gaugeability instructions

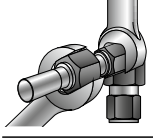
1. Parker MPI™ Fittings are sold completely assembled and ready for immediate use. Simply insert the tube as illustrated until it bottoms in the fitting body. (If the fitting is disassembled, note that the small tapered end of the ferrule(s) go into the fitting body.)



2. For MPI™ Fittings, turn the nut to the “finger-tight” position. Hold the fitting body with a second spanner to prevent the body from turning as you continue tightening the nut. For hand assembly, tighten the nut 1-1/2 turns and for a preset connection (required for 3/4” and 1”) tighten the nut 1/2 turn only. Parker recommends that you mark the nut (using a scribe or ink) to help you count the turns.

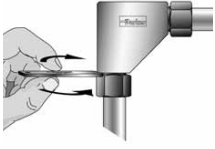


3. For maximum number of remakes, mark the fitting and nut before disassembly. Before retightening, make sure the assembly has been inserted into the fitting until the ferrule seats in the fitting. Retighten the nut by hand. Rotate the nut with a spanner to the original position as indicated by the previous marks lining up. (A noticeable increase in mechanical resistance will be felt indicating the ferrule is being re-sprung into sealing position.)



Tel: +45 63 12 83 00 | Email: ps@hymatik.com | www.hymatik.com | Hvidkaervej 27a, DK-5250 Odense SV, Denmark

4. Finally, check the gap between the nut and the body hex with the end of the gauge by inserting the gauge (as shown) into the beveled gap between the nut and body hex. Gently turn the gauge (that is, it “twists out”). **However, if the gauge slides into the beveled gap, (does not “twist out”) the fitting is not properly made up and you must check the entire assembly procedure.**



Gaugeability tools

MPI™ inspection gauge
This one handy gauge works for all MPI™ sizes. The end of the gauge checks the fitting gap after make-up.

Suparcase® - ferrule hardening

In order to ensure effective tube grip for high pressure applications thicker wall tubing, ferrules should be hardened.
At Parker Hannifin we have invested large resources into our research and development area to perfect a process which will overcome the problems associated with other hardening processes of austenitic stainless steel. This revolutionary process gives an infusion of hardness as an all over treatment, but also increases the corrosion resistance.
The CPI™ ferrule, both MPI™ ferrules and the back ferrule of the A-LOK® fittings all undergo Suparcase® treatment for optimum performance.

Traditional nitride hardening of the leading edge of a back ferrule
Nitriding is a method of infusing hardness over a selected area. It increases the carbon level in the surface of the area and ensures a correct and consistent level of hardness. However it changes the structure of austenitic stainless steels and reduces its corrosion resistant properties.

A Suparcase® ferrule
The photograph below illustrates the all over hardness zone of Suparcase® which has been highlighted by etching. As one can see, the zone itself is unaffected by the acid attack.

(1) If more specific information, including heat code traceability, is required, your Parker Hannifin distributor will provide details.
(2) Stainless steel tube fittings work reliably on both seamless and welded-redrawn, fully annealed type 304, 316 and 316L tubing.

Heat code traceability

Parker Hannifin's Instrumentation Connectors Division offers Heat Code Traceability (HCT) on CPI™, A-LOK®, Instrumentation Pipe, Automatic Buttweld, Weld-lok®, PHastite®, MPI™, and Sandvik. HCT refers to the fact that a specific part can be traced back to the original mill heat of metal from which it was made. Beginning with the original melt, a package of documents is created which completely describes the metal in physical and chemical terms. The end result is that a number, which is permanently stamped to the part, refers back to the document package.
The HCT number is stamped on the material (bar stock or forging) prior to manufacturing. The concept is useful because it provides a method for complete material accountability for the manufacturer and end customer.

HCT offers these advantages:

- Raw materials for manufacture must meet code requirements. This can be verified through documentation so that the customer is certain that what is ordered is received.
- HCT provides a record of chemical analysis with the raw material thus, in areas requiring welding, the correct welding technique is applied.
- HCT relieves the user of Parker Instrumentation tube fittings of any doubts. It acts as an assurance for today and for tomorrow.

Parker grade tubing

Reduce your lifecycle costs
When selecting tubes for your hydraulic or instrumentation systems, some critical questions are often raised. For example, how knowledgeable are your suppliers about your process? How good are their products? If something goes wrong, how quickly can you get support or a replacement part?

As a leading worldwide supplier of seamless stainless tubes in both straight lengths and coils, Sandvik is uniquely equipped to help you address these challenges. With more than 100 years of experience in producing stainless steel, we continue to support our customers with the following:
Sandvik's technical knowledge is based on a long tradition of

R&D, which has resulted in a wide range of new products over the years. Combined with hands-on experience dealing with a variety of process environments, Sandvik and its representatives are equipped with the knowledge you need for the solution you want.
Our integrated production system ensures quality control through the entire manufacturing chain, from our steel melting plant to the finished product. Our quality standards help to ensure the long lifecycle of the tubes we deliver, as well as their traceability.

With a wide stock assortment and distribution capacity, we can deliver the product you want when you want it. Our tubes are end-capped and carefully packed to ensure you get the product you want in the same shape it left the mill.

And, finally, with an extensive global network of sales and service units, together with the Parker tube fitting partnership, our representatives are locally available to help you find the most cost-effective long-term solution. You are in safe hands.

What makes a high-quality tube? The tubes we manufacture and deliver for hydraulic and instrumentation systems are noted for their quality and low lifecycle

Tel: +45 63 12 83 00 | Email: ps@hymatik.com | www.hymatik.com | Hvidkaervej 27a, DK-5250 Odense SV, Denmark

costs for the following reasons:

✔ We control every step in the tube production process, ensuring consistent quality in our product.

✔ We have well equipped corrosion testing laboratories, used for research purposes and for control of the influence of the production procedures on the material, that result in a product that offers high corrosion resistance.

✔ High surface smoothness and

close dimensional tolerances ensure there are no leakages when connecting straight tubes with couplings.

✔ All our products are characterized by the ovality, eccentricity and controlled hardness required for superior performance for hydraulic and instrumentation systems.

Two delivery forms: straight lengths and coiled
In answer to our customers' needs, we have developed two primary delivery forms of seamless stainless tubes – straight lengths and coiled. Your choice will depend on your process environment and your requirements. We can help you arrive at the most cost-effective solution for your needs.

Sandvik materials technology
Sandvik Materials Technology is a world-leading manufacturer of high value-added products in advanced stainless steels and special alloys.

Quality Assurance
Sandvik Materials Technology has Quality Management Systems approved by internationally recognized organizations. We hold for example: the ASME Quality System Certificate as a Materials Organization; approval to ISO 9001, QS-9000 and PED 97/23/EC, as well as approvals from LRQA, JIS, TÜV and others as a materials manufacturer.

Environment
Environmental awareness is an integral part of our business and is at the forefront of all activities within our operation. We hold ISO 14001 approval.

Engineer your cost savings with Sandvik and Parker

When you want to reduce the risk of leakages in your hydraulic and instrumentation system, consider Sandvik seamless stainless steel tubing, together with the appropriate Parker connector, increases the integrity of the overall system, reducing not only the risk of leakage but maintenance costs as well.

A material of choice

Our coiled tubing is the material of choice for control lines and chemical injection lines, instrument lines, steam or electrically traced tubing, pre-insulated tubing, stack tubing and heater hose, among others.

Key advantages of Sandvik tubing together with Parker fittings

- Good quality surface finishes together with close tolerance manufacturing, reduces the risk of leakage and the need for inspection and maintenance.
- High degree of material utilisation reduces scrap generation.
- Compact packaging facilitates easy shipping and storage.
- Improved system integrity enhances operational safety and security.

Pressure ratings and wall thicknesses of tubes used with Parker A-LOK®, CPI™, MPI™ and PHastite® connector ranges.

For temperatures up to 93° C (200° F) when used with the appropriate Parker connector ranges. These tables also show the minimum and maximum wall thickness of tubing that shall be used within the scope of the appropriate Parker connector design range.

If a user chooses a tube wall thickness outside of those recommended in the tables, the user should first consult the Technical Department of Parker Instrumentation Products Division.

Derivation of pressure ratings

The working pressure ratings for stainless steel tubing have been derived from stress values and methodologies listed in ASME B31.3, Chemical Plant and Petroleum Refinery Piping Standard and based on the recommendations of ASTM A269. A pressure rating calculator to derive pressure ratings according to Swedish RN78 standard and Din 2413 can be accessed on www.sandvik.com.

Tubing hardness

Acceptable tubing hardness is indicated on the following tables.

Tubing ordering suggestions

Tubing for use with Parker connectors must be carefully ordered to ensure adequate quality for good performance. Parker recommends that Sandvik tubing manufactured to ASTM A269 standards should be specified and that any order should include the required tube diameter & wall thickness. More stringent requirements are sometimes added by user which include statements such as free from scratches, suitable for bending, capped ends.

Sandvik tubing will comply with these requirements as standard.

Table 1 Pressure rating (BAR) for metric size 316/316 Stainless Steel tubing for A-LOK® and CPI™ connectors

- Not recommended for gas service
- Recommended for all services - standard assembly
- Recommended for all services - Use pre-assembly tool
- Recommended for all services - Use 'Hyferset' pre-assembly tool
- No data/Not recommended/No solution

16			190	240	300	330	370	430		
18			170	210	260	290	330	380		
20			150	190	230	260	290	330	380	
22			140	170	210	230	260	300	340	
25					180	200	230	260	300	320

Special care must be taken when selecting tubing for Gas service utilising either A-LOK® or CPI™ connectors. In order to achieve a gas-tight seal, ferrules in these design ranges of connectors must seal against any surface imperfections. This is accomplished by the ferrules penetrating the surface of the tubing. Penetration can only be achieved if the tubing provides radial resistance and if the tubing material is softer than the ferrules. Thicker walled tubing helps to provide this resistance. Tables 1 and 2 indicates the minimum acceptable wall thickness for 304 or 316 stainless steel material in gas service. The ratings in the unshaded area indicates the combination of diameter and wall thickness which are suitable for Gas Service.

*Pressure ratings verified by tests based on 4:1 factor of safety, utilising ASTM A269 - 316 tubing with typical ultimate tensile strength of 600Mpa and hardness of between Rb 80 and Rb 90.

**0.035" and 0.8mm wall thickness tubes are not suitable for heavy vibration applications particularly where pressure pulsation is present, due to tube fatigue.

MPI™ Medium Pressure Fittings

Tables 1, 2 and 3 list the maximum suggested working pressure of various tubing sizes, according to material. Acceptable tubing diameters and wall thicknesses are those for which a rating is listed. Combinations which do not have a pressure rating are not recommended for use with MPI™ Fittings.

MPI™ Tubing
MPI™ tubing is marked "MPI" and is designed to provide optimum performance for MPI™ fittings. MPI™ tubing is nominal OD ±.003") 316 seamless stainless steel, cold drawn - 1/8 hard (unannealed) tubing. Tensile strength is approximately 40% higher than annealed tubing.

Table 1 **316 Stainless Steel (Seamless/Unannealed - 1/8 Hard)**

Tube Size inch	Nominal O.D. inch	Nominal I.D.	Working Pressure	MPI™ Tube Part No.
1/4	0.250	0.125	15,000	4-240 MPITUBE-SS-15K
3/8	0.375	0.216	15,000	6-240 MPITUBE-SS-15K
9/16	0.562	0.344	15,000	9-240 MPITUBE-SS-15K
3/4	0.750	0.469	15,000	12-240 MPITUBE-SS-15K
1	1.000	0.656	12,500	16-240 MPITUBE-SS-15K

NOTE: Working pressures calculated using an allowable stress of 35,000 psi for 1/8 hard 316 stainless steel tubing with a minimum tensile strength of 105,000 psi.

NOTE: Sizes 3/4" and 1" require hydraulic presetting when used with MPI™ fittings.

***Consult factory for pressure tables regarding other material.**

Cone & Thread Tubing
Cone & Thread (C&T) tubing is available as 1/8 hard 316 seamless stainless steel tubing and is designed to work with existing C&T fittings. C&T tubing has an undersized OD by as much as .010" to better facilitate the coning and threading operations required for use with C&T fittings. MPI™ fittings work effectively with C&T tubing as listed right but require hydraulic presetting for optimum performance.

Table 2 316 Stainless Steel (Undersized OD, Seamless (Unannealed - 1/8 Hard)

Table 4 Elevated Temperature Rating Factors

System Temperature

Operating temperature is another factor in determining the proper tubing material. While Alloy 400 tubing, for instance, is suitable for very low temperature media, materials such as Stainless steel tubing are suitable for higher temperature media. Special alloys such as Alloy C276 are recommended for extremely high temperatures.

Table 4 lists the de-rating factors which should be applied to the working pressures listed in Tables 1-16 for elevated temperature conditions. Simply locate the correct factor in Table 17 and multiply this by the appropriate value in Tables 1-16 for elevated temperature working pressure.

EXAMPLE:

Tubing Type 316 stainless steel seamless, 1/2 in. x 0.049 in. wall at 100 °F

- The allowable working pressure at room temperature (up to 100 °F) is 2800 psi (Refer to Table 1)
- The elevated temperature factor for 316 stainless steel is 0.77 at 1000 °F (Refer to Table 17)
- The allowable working pressure for 316 stainless steel tubing ½ in. x 0.049 in. wall at 1000 °F is then: 2800 psi x 0.77 = 2156 psi

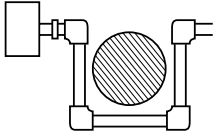
Table 4		Elevated Temperature Rating Factors						
Temperature		Tubing Material						
°F	°C	Stainless 316/316L*	6Mo	Alloy 400	Alloy 625	Alloy 825	Alloy C276	Titanium Gr. 2
100	38	1	1	1	1	1	1	1
200	93	1	1	0.88	0.93	0.92	0.91	0.87
300	149	1	0.95	0.81	0.88	0.87	0.84	0.72
400	204	0.97	0.9	0.79	0.85	0.83	0.78	0.62
500	260	0.9	0.87	0.79	0.82	0.79	0.73	0.53
600	315	0.85	0.86	0.79	0.79	0.76	0.69	0.45
700	371	0.82	0.84	0.78	0.77	0.74	0.65	--
800	426	0.8	--	0.76	0.75	0.73	0.63	--
900	482	0.78	--	0.43	0.74	--	0.61	--
1000	537	0.77	--	--	0.73	--	0.6	--
1100	593	0.62	--	--	0.73	--	--	--
1200	649	0.37	--	--	0.72	--	--	--

* Dual-certified grades such as 316/316L, meet the minimum chemistry and the mechanical properties of both alloy grades.

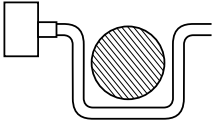
Tubing vs Piping

Standard fluid line systems, whether for simple household use or for the more exacting requirements of industry, were for many years constructed from threaded pipe of assorted materials and were assembled with various standard pipe fitting shapes, unions and nipples. Such systems under high pressures were plagued with leakage problems besides being cumbersome, inefficient and costly to assemble and maintain. Therefore, the use of pipe in these systems has largely been replaced by tubing because of the many advantages it offers.

Tubing provides simplified, free flow system.



Old Method - Each connection is threaded - requires numerous fittings - system not flexible or easy to install and service connections not smooth inside - pockets obstruct flow.



Modern Method - Bendable tubing needs fewer fittings - no threading required - system light and compact - easy to install and service - no internal pockets or obstructions to free flow.

Tel: +45 63 12 83 00 | Email: ps@hymatik.com | www.hymatik.com | Hvidkaervej 27a, DK-5250 Odense SV, Denmark

Major advantages of Tubing vs. Pipe

1. Bending Quality - Tubing has strong but relatively thinner walls; is easy to bend.Tube fabrication is simple.
2. Greater Strength - Tubing is stronger. No weakened sections from reduction of wall thickness by threading.

Pipe

Tubing

Figure 2
With no threading necessary, tubing does not require extra wall thickness

3. Less turbulence - Smooth bends result in streamlined flow passage and less pressure drop.

4. Economy of space and weight - With its better bending qualities and a smaller outside diameter, tubing saves space and permits working in close quarters. Tube fittings are smaller and also weigh less.

5. Flexibility - Tubing is less rigid, has less tendency to transmit vibration from one connection to another.

6. Fewer fittings - Tubing bends substitute for elbows. Fewer fittings mean fewer joints, fewer leak paths.

7. Tighter joints - Quality tube fittings, correctly assembled, give better assurance of leak-free systems.

8. Better appearance - Tubing permits smoother contours with fewer fittings for a professional look to tubing systems.

9. Cleaner fabrication - No sealing compounds on tube connections. Again no threading; minimum chance of scale, metal chips, foreign particles in system.

10. Easier assembly and disassembly - Every tube connection serves as a union. Tube connections can be reassembled repeatedly with easy spanner action.

11. Less maintenance - Advantages of tubing and tube fittings add up to dependable, trouble-free installations.

Common causes of imperfect bends

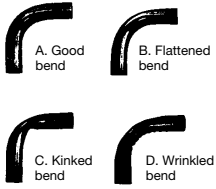
Figure A shows an ideal bend. Bends with little or no flattening are produced when correct equipment and methods are employed; when proper consideration is given to co-relationship of the radius of the bend, material wall thickness and hardness of the tube.

Figure B shows a flattened bend, caused by trying to bend too short a radius, or bending smaller diameter tube in larger radius block.

Figure C shows a kinked and flattened bend, caused by the tube slipping in the bender, or by using non-annealed tubing. Tubes must be firmly clamped by clamp block to prevent slippage during bending process.

Figure D shows a wrinkled bend, sometimes produced when thin wall tube is bent.

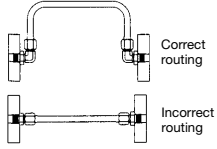
Breakage will sometimes occur when mandrel is too far forward in tube, or when too short a radius is attempts with hard tube.



Routing of bends

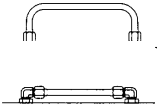
Routing of lines is probably the most difficult yet most significant of these system design considerations. Proper routing involves getting a connecting line from one point to another through the most logical path. The most logical path should:

Avoid excessive strain on joints - A strained joint will eventually leak.



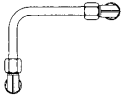
Correct routing

Incorrect routing

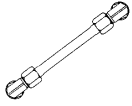


Correct routing

Incorrect routing

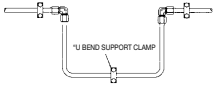


Correct routing



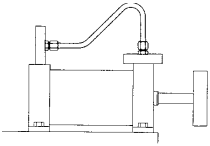
Incorrect routing

Allow for expansion and contraction - Use a “U” bend in long lines to allow expansion and contraction.



U-bend allowing for expansion and contraction

Allow for motion under load - Even some apparently rigid systems do move under load.



Bent tube allowing for motion under load

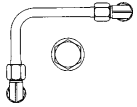
Tel: +45 63 12 83 00 | Email: ps@hymatik.com | www.hymatik.com | Hvidkaervej 27a, DK-5250 Odense SV, Denmark

Get around obstructions without using excessive amount of 90° bends - Pressure drop due to one 90° bend is greater than that due to two 45° bends.

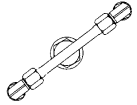
Correct

Incorrect

Keep tube lines away from components that require regular maintenance



Correct



Incorrect

Have a neat appearance and allow for easy trouble shooting, maintenance and repair

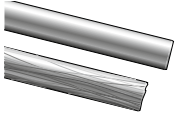
Proper tubing preparation

Tube end preparation is essential in assuring leak-free systems. Some important points to consider are:

- Handling Tubing
- Cutting Tube End with either a tube cutter or hacksaw
- Deburring the tube end
- Cleaning the tube end

Handling tubing

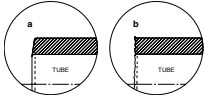
After tubing has been properly selected and ordered, careful handling is important.
From the receiving dock to point of installation, special attention is necessary to prevent scratching and burring the O.D. of the tubing. This is especially important for gas service. Low-density gases such as helium and argon cannot be sealed with damaged tubing.



Make certain not to drag tubing across any surfaces such as truckbeds, shelves, or storage racks, the floor and (or) ground of any plant/construction site. This is important for tubing of all materials. Besides scratching, improper handling can create out-of-round tubing. Out-of-round tubing will not fit the I.D. of the ferrule(s) or the body bore properly and will cause leakage.

Cutting the tube end

To insure a good joint, tube must be cut off square. This can be accomplished with either a tube cutter or hacksaw.



Enlarged section of tube showing differences in tubing cut with a tube cutter (a) and a hacksaw (b).

Tubing cutters

More commonly utilized on softer tubing such as copper, aluminum

Tel: +45 63 12 83 00 | Email: ps@hymatik.com | www.hymatik.com | Hvidkaervej 27a, DK-5250 Odense SV, Denmark

or even “soft” steel tubing. If a tube cutter is utilized with stainless steel tubing, remember that a special cutting wheel, designed for use with stainless steel tubing should be employed. The use of dull or improper cutting wheels can work harden the stainless steel tubing near the cut area. This CAN adversely affect the fittings sealing ability.

Cutting with a Hacksaw

When using a hacksaw to cut off tubing, it is essential to use a guide to assure square cutoffs. We recommend our Tru-Kut vise Model #710439 (see picture on the left). Further, to minimize the residual burrs, a hacksaw blade of 32 teeth per inch minimum is suggested.

Deburring the tube end

The burrs formed by either the tube cutter or hacksaw must be removed prior to assembly to prevent those burrs from eventually damaging the system. O.D. burrs can prevent tubing from seating properly in a fitting body. I.D. burrs can restrict flow, as well as possibly break loose and damage fine filtration elements.

Note: Do not over deburr the O.D. of tubing.
You may deburr the tubing with your choice of file(s), or utilize Parker’s IN-EX De-Burring tool Model #226. This tool can be used to deburr both the I.D. & O.D. of tubing sizes 1/8” to 1 5/8” (3mm-41mm).

Cleaning the tube end
After you deburr the tubing, it is essential to remove burrs from the tubing line. This can be accomplished by:

1. Flushing with solvent or low pressure compressed air.
2. Swab with lint-free cloth.

Again, this should prevent entrapping one of these small burrs down-stream where it might do some system damage.

Full kit of all eleven spanners	860062-KIT	Full kit of all eight spanners	860062-KIT2	Full kit of all ten spanners	860063-KIT

Par-Lok Spanner Kit

Easy access ratchet spanner speeds fittings installation in tight locations. Rugged, snap-action jaws can be opened over tube lines, locked onto fitting hex and ratcheted with 1/8 turn. Full six point contact prevents fitting distortion common with spanner slippage. Ideal for tube line installations where compact runs require multiple fittings make-up disassembly and remakes.
360 degree snap-action ratchet spanners are available individually or

in three different kit combinations. Par-lok jaws are constructed from drop-forged high carbon steel material with a black conversion coat finish. Par-lok handles are made from heavy gauge steel material heat treated and with a corrosion resistant black finish. Solid stainless steel rivets and tempered jaw springs are designed into every spanner for maximum strength.

Hand tube bender

Imperial

Tube O.D. inch	Part number	Bend radius inch	Weight kgs.
1/4	PTB-4T	9/16	0.54
3/8	PTB-6T	15/16	1.68
1/2	PTB-8T	1 1/2	3.45

Metric

Tube O.D. mm	Part number	Bend radius mm
6	PTB-6M	14.3
8	PTB-8M	23.8
10	PTB-10M	23.8
12	PTB-12M	38.1

Sturdy easy to use hand tools for fast accurate bending without kinks or visible flattening.

These benders can also be used in a vice for additional comfort and convenience.

Tube bender - sets

Description	Part number
Bench or vice mounted tube bender sets to suit a full range of imperial and metric tube sizes	412-EXACTOL 1/4”-3/4” O.D. (6mm-20mm) 420-EXACTOL 1/4”-1.1/4” O.D. (6mm-32mm) 424-EXACTOL 1/4”-1.1/2” O.D. (6mm-38mm)

Requires less force to operate than similar tube benders.

Designed for bending copper, Aluminium, coated and stainless steel tubing in both metric and imperial sizes. Bends up to 180°.

Tube cutters

Description	Part number
Tube cutter	PT - C
Spare cutter wheels	PT - CS
Tube cutter for exotic materials	PT - CE
Spare cutter wheels	PT - CES

Adjustable tube cutters which produces a clean square end with no external burr and minimum internal burrs.

The design of these cutters not only allows accurate positioning of the tubing onto the rollers but also allows the cutter wheel to be positioned both quickly and easily.

The 218B cutter is suitable to be used on copper, aluminium, steel and stainless steel tubing from 1/8" to 1.1/8" O.D. (3mm to 27mm O.D.) and the 635B is designed for use on harder exotic materials for tubing from 1/4" to 1.3/8" O.D. (6mm to 35mm).

TRU-KUT sawing vice

Description	Part number
TRU-KUT (for 3/16" to 2"O.D. (5-50mm)	PT - V

A robust hacksaw guide to accommodate tube, pipe and hose in sizes 3/16" to 2" O.D. (5mm to 50mm O.D.) and assures square cut-offs, clean ends and minimum bending.

This guide is used by mounting into a vice or it can be bolted to a bench for a more permanent fixture.

The tube is clamped into position and cut utilising the guide which gives accurate square cuts every time.

Tel: +45 63 12 83 00 | Email: ps@hymatik.com | www.hymatik.com | Hvidkaervej 27a, DK-5250 Odense SV, Denmark

IN-EX Tube de-burring tool

Description	Part number
IN-EX de-burring tool	PT - D
Replacement blade	PT -DS

De-burrs both inside and outside of tubing from 1/8" to 1.5/8" O.D. (3mm to 41mm O.D.). The tool has two special cutting blades arranged to present four cutting edges either internal or external de-burring.

This tool is used by inserting the tube into one end for inside de-burring and the opposite end for outside de-burring.

Rotate in either direction, the tool centres itself on the tubing.

Typical fastening threads

NPT Threads
The National Pipe Taper thread has a thread angle of 60°, and is mainly used in the petrochemical and process industries.

NPT - National Pipe Taper threads for connections where pressure-tight joints are made on the threads utilising a thread sealant.

Thread standard
ANSI/ASME B.20.1-1983

Thread size	Thread per inch	E_1 inch	E_1 mm	l_1 Nominal inch	l_1 Nominal mm	l_3 Nominal threads	l_4 inch	l_4 mm	l_4 inch	l_4 mm

Finger tightening

Spanner tightening

Typical fastening threads (Cont'd)

BSP Threads
BSPP and BSP Taper threads have a thread angle of 55°.

The spot face surface must be square to the pitch diameter and free from longitudinal and spiral tool marks.

BSPP - British Standard Pipe parallel threads for tubes and fittings where pressure-tight joints are not made on the thread, i.e. a peripheral seal is used.

BSP Taper - British Standard Pipe Taper threads for tubes and fittings where pressure-tight joints are made on the threads.
See diagram on page 136

146

The sealing of threaded connections

Interference sealing of taper threads
Pressure-tight joints of screwed connections with taper threads are achieved by the application of a sealant to the surface of the external male thread.

PTFE Tape
PTFE tape should comply with BS7786 with dimensions of 12mm wide by 0.075mm±10% thick.

The procedure for applying PTFE tape should be as follows:

1) Commencing with the first thread, five layers of tape should be applied, pulling the tape firmly into the threads without breakage.

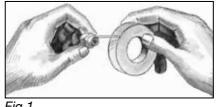

Fig 1

2) Tape should always be wrapped in the direction of the thread helix.

3) After five layers of tape have been applied the remaining exposed threads should be covered with tape using a 50% overlay.

4) The tape should be inspected to verify that no tape overhangs the front of the thread and that the tape has not been shredded.

Sealing compounds and liquid sealants
Apart from polymer joint compounds and air-drying liquid sealants, the most common thread seal is an anaerobic synthetic resin which cures in the absence of air.

Following assembly and tightening, the curing process is induced by a catalytic reaction between the resin and the metal. Resins that contain PTFE ease disassembly. For applications in food related industries, the thread sealant must be to a specified food-grade. Connections are normally made ready for operation following one hour curing time, complete curing may take up to 24 hours.

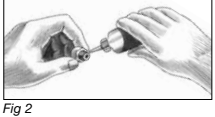

Fig 2

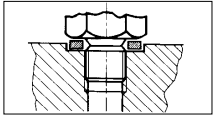
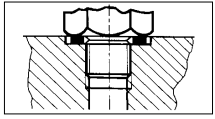
Peripheral sealing of parallel threads

Pressure-tight joints of screwed connections with parallel threads are achieved by placing a seal between the two machined faces

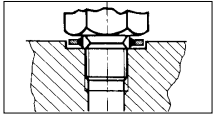


Flat seals
Washers and rings are manufactured in many different materials including fully annealed 316 stainless steel, copper, aluminium, fibre, plastics.

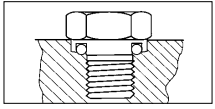
The tightening torque at assembly will vary according to the tensile strength of the fitting material, and the elasticity of the peripheral seal. The torque should be carefully selected to avoid compressing soft seals to the point of extrusion. As a general rule the fitting should be spanner tightened approximately 1/4 turn from the finger tight position.



Bonded seals
Elastomer sealing rings bonded into metal washers. Bonded seals are reusable, and cater for a variation in the quality of the machined surfaces.



ED seals
Groove machined into connector body and sealed using elastomer ring.

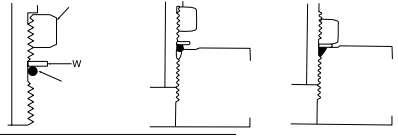


BSPP / SAE Straight Thread Fittings Installation Procedure

1. Lubricate O-ring with a lubricant that is compatible with the system.
2. Screw fitting into the straight thread port until the metal back-up washer contacts the face of the port.
3. Position the fitting by backing it out no more than one turn.
4. Hold the fitting in position and tighten the locknut until the washer contacts the face of the port. (See torque chart.)

Note: WLN Lock Nuts are ordered separately by size and part number.

SAE



Size	Straight port Torque (in-lbs)	(F.F.F.T)	Adjustable port Torque (in-lbs)	(F.F.F.T)
4	245 ± 10	1.0 ± .25	200 ± 10	1.5 ± 25

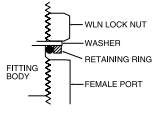
24	4500 ± 100	1.5 ± .25	3450 ± 100	2.0 ± 25

BSPP



Notes
- Restrain fitting body on adjustables if neessary in installation.
- Values in charts are for assemblies with)-ring lubricated.
- Use upper limits of torque ranges for stainless steel fittings

Tel: +45 63 12 83 00 | Email: ps@hymatik.com | www.hymatik.com | Hvidkaervej 27a, DK-5250 Odense SV, Denmark

Face Seal O-Ring Fittings Installation Procedure

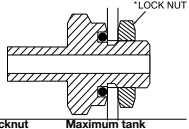
The O-ring requires a smooth, flat seating surface.This surface must be perpendicular to the axis of the threads.

1. Turn the O-ring seal fitting in the port until finger tight.
2. The “squeezing” effect on the O-ring can be felt during the last 1/4 turn.
3. Snug lightly with a spanner.

***Typical Application**
The fitting can be adapted as a bulkhead fitting on thin wall tanks or vessels, eliminating welding, brazing or threading. Simply order the L5N locknut to take advantage of this option.

Notes
Standard O-rings are nitrile material. For other O-rings, state material after the part number.

L5N locknuts are ordered separately by size and part number.



Port Size	Straight thread machine length	L5N locknut thickness	Maximum tank wall thickness
2	.297	.219	.078 = 5/64
3	.297	.219	.078 = 5/64
4	.360	.250	.109 = 7/65
5	.360	.250	.109 = 7/64
6	.391	.265	.125 = 1/8
8	.438	.312	.125 = 1/8
10	.500	.360	.140 = 9/64
12	.594	.406	.188 = 3/16
14	.594	.406	.188 = 3/16
16	.594	.406	.188 = 3/16

O-rings used with SAE/MS straight threads are nitrile. Other O-ring materials are available on request. Lubricate O-ring with a lubricant compatible with the system fluid, environment and O-ring material.

Exotic materials

Material selection is proving increasingly critical in many of today's Instrumentation applications. There are many factors which metallurgists take into consideration before selecting the correct material to suit the media, or even the environment, products are being used with. This could simply be to work at higher temperatures or pressures than the industry standard 316 Stainless Steel will allow. Some applications call for a high strength versus weight ratio which allows a much thinner section of tubing to be used to achieve the pressure required but at a much reduced weight. The most common reason for selecting an Exotic material would be to combat media or environmental corrosion. There are many types of corrosion we find in our market place and if a product fails in service due to corrosion it can prove extremely expensive, and more importantly, very dangerous. The common types of corrosion Parker see include Pitting, Crevice, Stress, Microbially Influenced (MIC) and Galvanic.

The selection of material has to be cost effective for the user. For example, if the rate of corrosion is likely to be slow, it could be more cost effective to select a lower cost item and change it out when it has deteriorated, compared to paying a high initial product cost and not having to change out.
A number of criteria have to be taken into consideration by the user before the decision can be made on which material, or indeed which manufacturer should be used, such as:

- Critical nature of the system
- Media contained within the system
- Environmental influences
- Rate of corrosion
- Frequency of change out
- Cost of product
- Installation costs
- Downtime costs when changing out product (i.e. loss of production)
- Inventory costs
- Product quality

In this booklet there are listed a range of alloys from which Parker manufactures a variety of Fitting and Valve products for Instrumentation and associated applications.

6MO

UNS S31254

6MO is an austenitic stainless steel which because of its relatively high molybdenum content possesses a very good resistance to pitting and crevice corrosion.

This grade of steel was developed for use in halide containing environments where crevice, pitting and stress corrosion attacks are prone.

6MO is especially suited to handle high-chloride environments such as brackish water, seawater, caustic chlorides and pulp bleach systems.

Microbially Influenced Corrosion (MIC) can occur in brackish and waste water systems especially where equipment has been idle for extended periods. 6MO is extremely resistant to MIC and for this reason is also being used where bacteria and algae form "biofilms" on metal surfaces in warm seawater in areas such as the Middle East, Irish Sea and the Gulf of Mexico.

Typical applications include:

- Service water streams for nuclear power plants
- Offshore platform equipment
- Petrochemical and Seawater cooling systems
- Salt plant evaporators
- Bleach lines in pulp and paper mills
- Desalination plant equipment
- Fire fighting systems
- Tube heat exchangers
- Instrument measuring lines

Alloy 400

UNS N04400

Alloy 400 was the first nickel alloy invented, back in 1905 and remains one of the most extensively used nickel alloys due to its excellent corrosion resistance to a wide range of media. Alloy 400 has outstanding resistance to neutral and alkaline salts. It has been a

standard material for salt plants for many years.

This alloy is one of the few metallic materials, which can be used in contact with fluorine, hydrofluoric acid, hydrogen fluoride or their derivatives. Alloy 400 shows very high resistance to caustic alkalis. Its behaviour in seawater is excellent, with improved resistance to cavitation corrosion compared with other copper based alloys. It can be used in contact with dilute solutions of mineral acids such as sulphuric and hydrochloric acids. However, it is important to note that, as the alloy contains no chromium, corrosion rates may be increased in oxidising conditions.

Whilst Alloy 400 can be considered immune to chloride-ion stress cracking, it can stress crack in the presence of mercury or in most aerated hydrogen/fluoride vapours.

Typical applications include:

- Service water streams for nuclear power plants
- Uranium refining and isotopes separation used in the production of nuclear fuel
- Offshore platform equipment
- Petrochemical and seawater cooling systems
- Salt plant evaporators
- Desalination plant equipment
- Fire fighting systems carrying seawater
- Tube heat exchangers
- Instrument measuring lines
- Feed-water and steam generator systems in power plants
- Equipment used in the manufacture of chlorinated hydrocarbons
- Sulphuric and hydrofluoric acid plants

Fe	2.5 max

Alloy 825

UNS N08825

Alloy 825 is a titanium-stabilised fully austenitic nickel-iron-chromium alloy with additions of copper and molybdenum.

This alloy is characterised by its good resistance to stress corrosion cracking and to oxidising and non-oxidising hot acids alike. It also has a very satisfactory resistance to pitting and crevice corrosion. Alloy 825 is a versatile general engineering alloy with good

resistance to corrosion in a wide range of media such as sulphuric, sulphurous, phosphoric, nitric and organic acids, alkalis such as sodium or potassium hydroxide, and aqueous chloride solutions. Its high nickel content gives this alloy almost complete immunity to stress corrosion cracking.

Typical applications include:

- Heat exchangers, evaporators and other equipment in phosphoric acid plants
- Fuel element dissolvers
- Sulphuric acid pickling plants
- Seawater cooled heat exchangers
- Chemical plants
- Food processing
- Sour gas applications
- Down hole control lines for oil and gas production

Alloy 625

UNS N06625

Alloy 625 is a low–carbon, nickel-chromium-molybdenum-niobium alloy which shows excellent resistance to a variety of corrosive media.

This alloy has outstanding resistance to pitting & crevice corrosion as well as good resistance to intergranular attack. It also has almost total resistance from chloride-induced stress corrosion cracking. With these properties of the alloy, it has extremely high resistance to attack by a wide range of media and environments including nitric, phosphoric, sulphuric and hydrochloric acids, as well as alkalis and organic acids in both oxidising and reducing conditions. Alloy 625 has virtually no corrosive attack in marine and industrial atmospheres with extremely good resistance to seawater, even at elevated temperatures.

Typical applications include:

- Flue gas scrubbers
- Phosphoric and other acid producing facilities
- Nuclear waste reprocessing equipment
- Sour gas applications
- Offshore industry particularly in warm environments
- Marine equipment applications
- Turbines
- Aerospace industry, particularly fuel and hydraulic lines

Alloy C-276

UNS N10276

Alloy C276 is a nickel-molybdenum-chromium wrought alloy, which is generally considered to be the most versatile corrosion resistant alloy currently available.

C276 has outstanding resistance to localised corrosion and to both oxidising and reducing media. It has very good resistance to a wide range of chemical process environments, including strong oxidisers such as ferric and cupric chlorides, hot contaminated media, chlorine, a variety of acids and seawater and brine solutions. It is one of the few materials that withstand the corrosive effects of wet chlorine gas, hypochlorite and chlorine dioxide.

This alloy is a favourite with chemical plants because of its excellent mechanical properties giving it good durability in addition to its resistance to aggressive process fluids.

Typical applications include:

- Heat exchangers
- Flue gas desulphurisation systems
- Production of hydrofluoric acid
- Transfer piping lines
- Reaction vessels
- Pollution control/stack gas equipment containing chlorides, sulphur oxides, nitrogen oxides, carbon dioxides and carbon monoxide.

- Waste treatment equipment
- Instrument measuring lines
- Pulp washing equipment
- Sulphuric acid applications such as pickling baths and detergent manufacture
- Chlorine dryers and other wet chlorine applications

Titanium

UNS R50400

The titanium material used for Instrumentation products is what is known as commercially pure or unalloyed. It has proven to be technically superior and a very reliable and cost effective material in a wide range of chemical, industrial, marine and aerospace applications.

Titanium exhibits superior resistance to chlorides and many forms of corrosion. The material is immune to chloride pitting and intergranular attack and is highly resistant to crevice and stress corrosion. Titanium and its alloys have a number of unique properties, which make them a good choice even when strength or corrosion resistance may not be critical. These properties include important equipment design factors, such as low density, high melting point, non-magnetic, an extremely short radioactive half life, very low modulus of elasticity and co-efficient of expansion. These factors allow the material to be very flexible whilst giving extremely high strength properties against a very much reduced weight ratio.

Typical applications include:

- Gas turbines
- Heat exchangers
- Chemical plants for the production of chlorine, hypochlorites, acids and other aggressive compounds
- Desalination plants
- Cooling and piping systems in marine applications
- Hydrocarbon processing

- Pulp and Paper plants
- Condensers
- Nuclear waste re-processing systems
- Flue gas desulphurisation systems

Parker's product selection guide CD contains electronic versions of all catalogs referenced in the product selection guide document as well as additional Parker Instrumentation product lines

Small Bore Expert Training

This is an upgrade and replacement to our industry leading Safety at Work Programme, it provides material that is relevant to your sales professionals and will enable them to conduct their own training sessions with their customer base.

Some of the advantages over our existing programme are:

- Greater knowledge of small bore tubing systems
- Increased product familiarity
- Improved selling and presentation ability
- Increased skills and confidence in dealing with small bore systems
- Ability to deliver chargeable training

Utilising our new range of Tube Fabricating Equipment, you will undertake tube bending and fittings make-up exercises.

For more information about the content and for course dates please contact +44 (0) 1271 313131 and ask to speak to the Marketing Department, alternatively please email your enquiry to: ipd@parker.com
