Parker Motion Controller - PAC

Overview

Description

The Parker motion Controller PAC is a PLC basing on ARM with integrated CODESYS. This programmable motion controller combines machine logic, real-time motion control and visualization into a standard based, performance driven, fan-less and easily mountable din rail solution.
The controller matches the PACIO modules, which can be attached directly to form a mechanically and electrically homogenous unit. In combination with these modules, it can take over complete machine control.
Equipped with a native, real-time EtherCAT bus, a modular interface slot, standard Ethernet and USB ports plus a built-in SD-card slot and the supported fieldbus options Profinet Slave, EtherCAT or EtherNet/IP the controller can be easily integrated and is suitable for a wide range of applications.

Programmed with CODESYS, efficient and powerful control systems can be designed based on IEC61131-3 and PLCopen motion standards. Offering the OPC UA server the controller is the perfect device for industry 4.0 communication.

Our PAC motion controller is available in two different versions:
PA120 and PAC340.
PAC120 is suitable for many motion applications.
For higher demands on performance and memory the PAC340 is available. With its four processor cores, it also supports the CODESYS multicore feature.

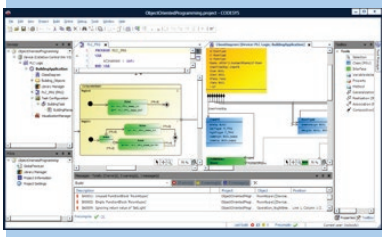
Software

CODESYS is the leading manufacturer-independent IEC 61131-3 automation software for engineering control systems. It's a software platform for industrial automation technology. The core of the platform is the IEC-61131-3 programming tool "CODESYS Development System". It offers practice-oriented, integrated solutions for the convenient configuration of automation applications. Everything is integrated in a single user interface



Engineers can work smarter, more efficiently and more effectively by choosing from the five IEC standard programming languages to optimize for an application, by using industry standard PLCopen Motion for motion control programming, deploying to the powerful simulation runtime for faster development and using online variable watch and trending for logic analysis.

Parker Remote I/O System PACIO

The PACIO System comprises a variety of modules for digital, analog and temperature signals as well as communication interfaces. The modules connect directly to the controller via the built-in EtherCAT bus for local architectures and are extended to remote locations via the extender and bus coupler modules, thus supporting both local and distributed I/O architectures. PACIO communicates natively on the EtherCAT bus, therefore it provides the full functionality and throughput of high-speed Ether- CAT to meet the most demanding real-time requirements. For further information see Parker catalogue file for the PACIOs.
